

input

Very simple, given a number, find its opposite.

1. set function to opposite with parameters/ argument with value of number

output

1: -1
14: -14
-34: 34

2. return negative parameter number
the logic behind this is that two negatives cancel each other out, making it a positive.. and when i need a negative from a positive, returning negative number simply makes my solution a negative...
