

input

Very simple, given a number, find its opposite.

1. set function to opposite with parametars/ argument with value of number

output

1: -1  
14: -14  
-34: 34

2. return negative number

the logic behind this is that two negatives cancel each other out, making it a positive.. and when i need a negative from a positive, returning negative number simply makes my solution a negative...
